

Seedcum Fertilizer Drill Machine

The seeding attachment is designed to use with all types of 9 Tine Tillers. Seed is fed for sowing by gravity from a hopper through pre-selected holes via plastic tubes to boots fitted on the Tiller Tines. Clogging and bridging of seed at the aperture is prevented by special rubber agitators mounted on a shaft driven by the ground wheel.

To cover requirements of a variation in seeds and seeding rates, a set of strip is supplied and the aperture of holes is adjustable by handle provided at the side of hopper.
